

Loading for Success

A NEW CONTAINER SYSTEM

Much care and thought has went into the design of our containers. A new loading methodology makes loading for containerized moves easy to accomplish and secure. Average load time varies, however a two hour load window is recommended.

VISUAL SECTIONING

Cross rails serve as visual indicators which aid in determining loading zones. By placing specific items in each zone, you insure the best utilization of space and reduce the possibility of load shifting due to a loose load.

PROTECT THE OUTER EDGES

The container is steel and will hold up better than your belongings. Protect perimeter items with blankets or cardboard. Use the container mesh to secure using wire ties or rope.

It's all about the base

PLACE HEAVY ITEMS ON THE FLOOR.

The floor is an outer edge as well and will scratch and damage items that are not protected. Do NOT lay items on their sides, rather stand vertical on the lower level. If you must lay items on their side, protect by placing a buffer layer of cardboard or a blanket.

Get a grip

BUNGEE ANYWHERE

The container design allows for increased anchorage. Attach bungee cords to the cross braces or the cage itself. Use as many anchor points as you need, you can even use the roof!

Middle holds the most

CREATE LEDGES TO ACT AS SHELVES

Medium sized boxes, dining chairs, mid sized coolers all are candidates for mid zone items. Blanket all items with surfaces that can be damaged. Blanket between the low items and the middle zone. Be creative when loading the middle zone, turning a piece on it's side may actually load more. Try to create tight groupings and fill empty areas as much as possible. Look for empty areas in the lower zone and fill them.

Protection Bubble

BUBBLE WRAP ITEMS THAT MIGHT POKE OUT.

Legs of chairs, tables and other items that are smaller than the mesh openings can poke through the container and damage themselves or nearby items. Wrap the legs with bubble wrap and while your at it unleash your inner child and pop a few! You can also use the bubble wrap in place of a blanket. Secure bubble wrap and blankets using packing tape. Use more than you think you would need.

Top it off

LIGHT OR SOFT ITEMS FILL THE EMPTY AREAS IN ALL ZONES

Fill the remaining zone with pillows, blankets and small items. Fill as much as possible with these smaller items. You will be able to reach these areas throughout the process allowing room for the unplanned to fit as well.

Properly Loaded Section

Build a wall

WALLING OFF SECTIONS AVOIDS SHIFTING IN TRANSIT.

Use the container to help locate load divisions. Use a mattress or a headboard or vertical dresser to section off your container into manageable sections. Front, center and rear is usual.

Secure the sections using ratcheting straps

Rope, bunjee cords or plastic fencing secured with zip ties can be used as well.

Finish and Close

CLOSE THE DOOR OF YOUR FULLY LOADED CONTAINER.

You will be surprised at just how well the container loads. A completely loaded container has very little unloaded area. If you load in zones and sections, all belongings will fit tightly and secure and no shifting will occur during transit.

Take a picture with your smart phone prior to shrink wrapping. This photo will go to the care taken while in your custody.

Lock it

YOU KEEP THE KEYS

Insured security by owner control. Your items are loaded once and remain locked until it arrives at your destination.

NOTE:

Take a picture with your smart phone. This will show control belongs to the owner.
